Topic- EC2 instance and creation

➢ What is EC2 Service ?(Iaas)

It is known as ELASTIC CLOUD COMPUTING SERVICE which use to create virtual servers using instance .

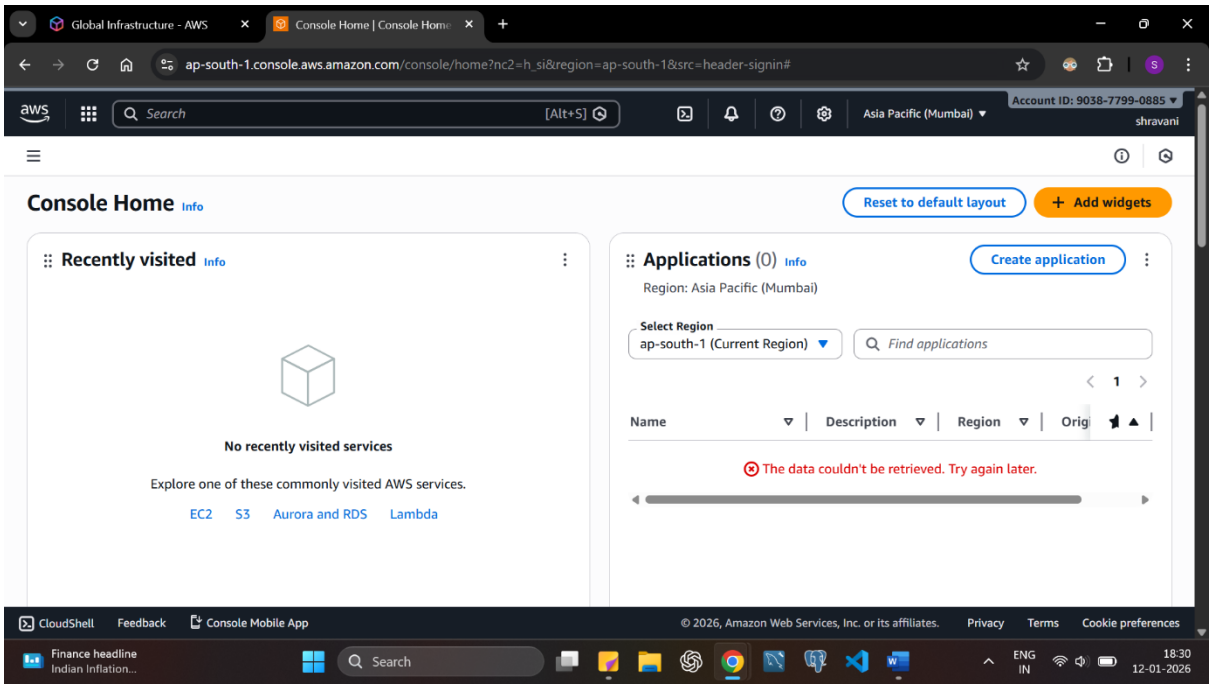
It is called as elastic because you can scale up and down easily as per your need .

You can rent this service and can pay only for what you used , the main characteristics of EC2 are scalability, flexibility and it is cost effective

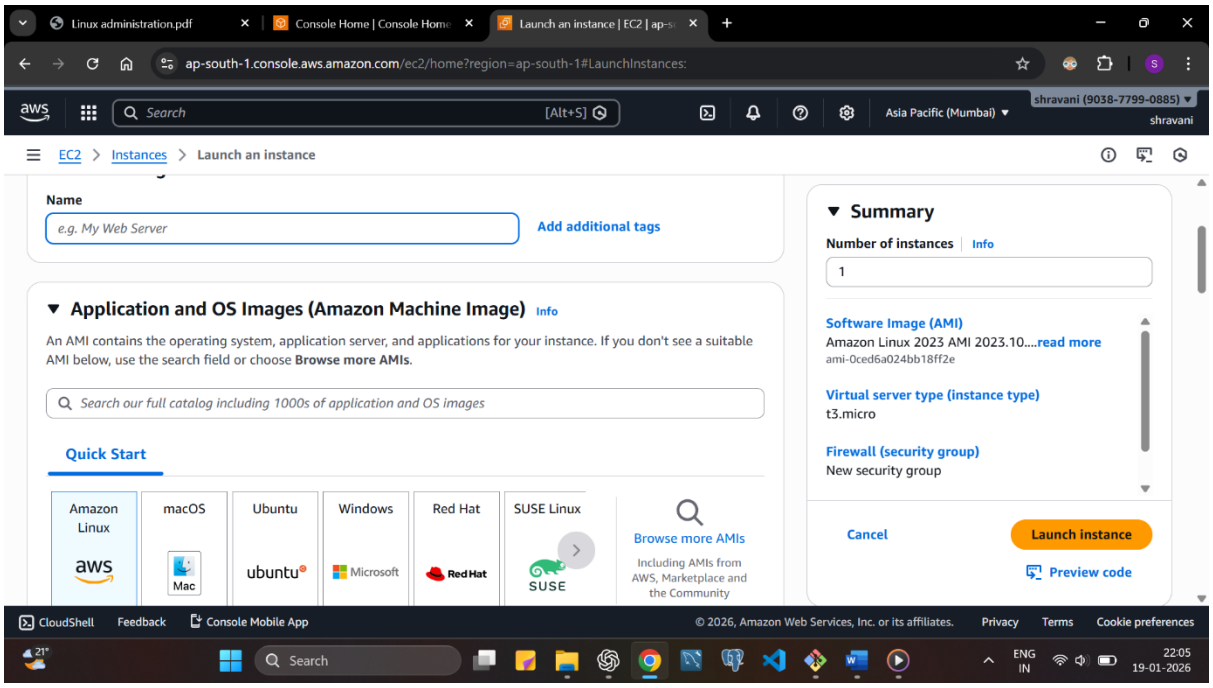
In this service you customise your needs like you can choose operating system ,storage and this system commonly used for hosting websites and web applications.

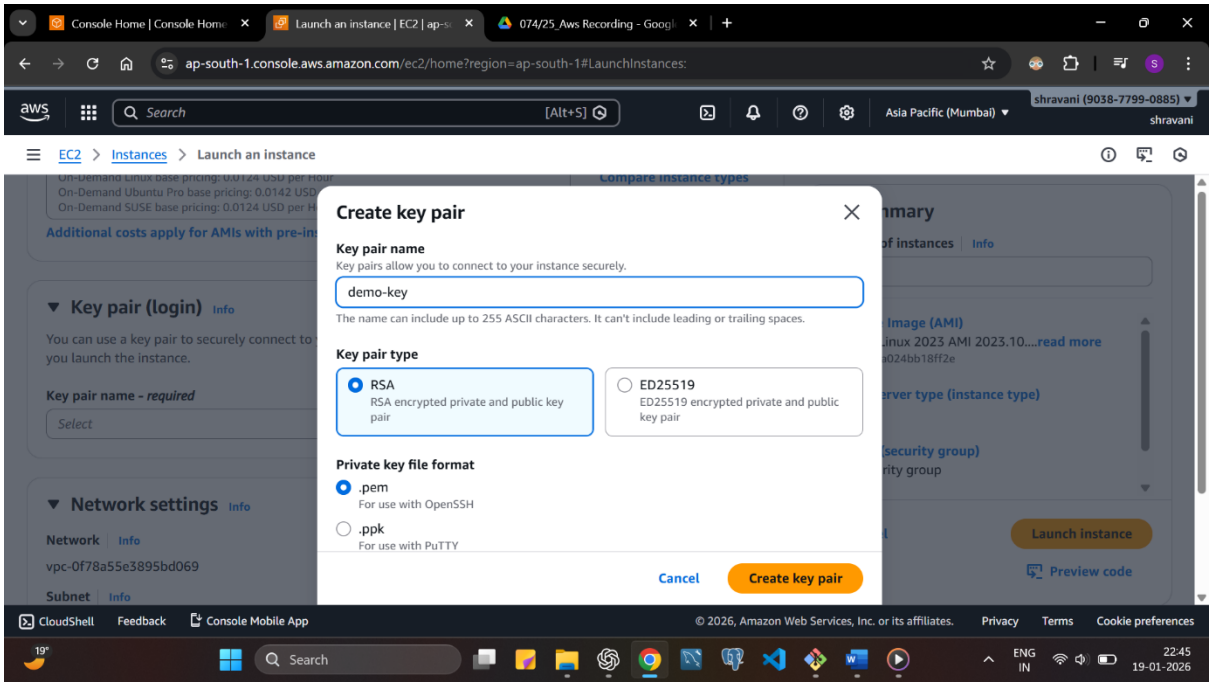
➢ Steps to create INSTANCE

1. First open AWS console check region then go to EC2 right click and open it in new tab

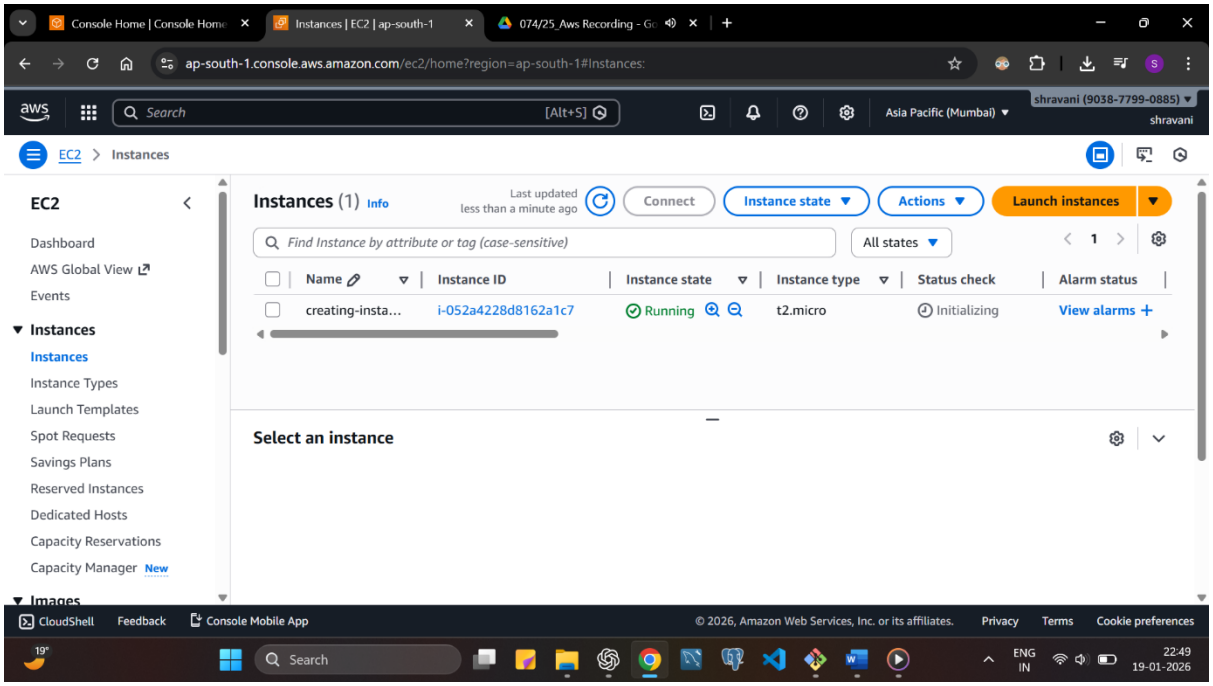


2.Click on launch instance fill the name column and create a key pair

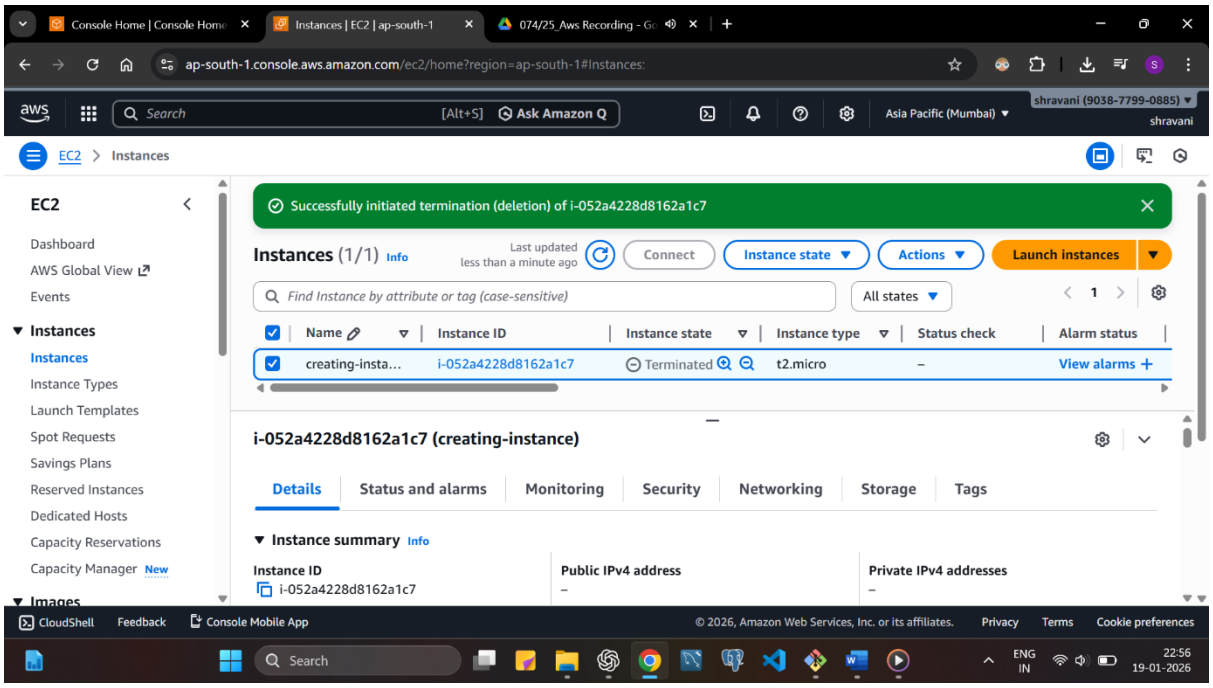




3.after instance got launched read the dashboard and information.



4.After using always Terminate your instance, if you click on stop it will stop only the server not the 8gb space it is using.

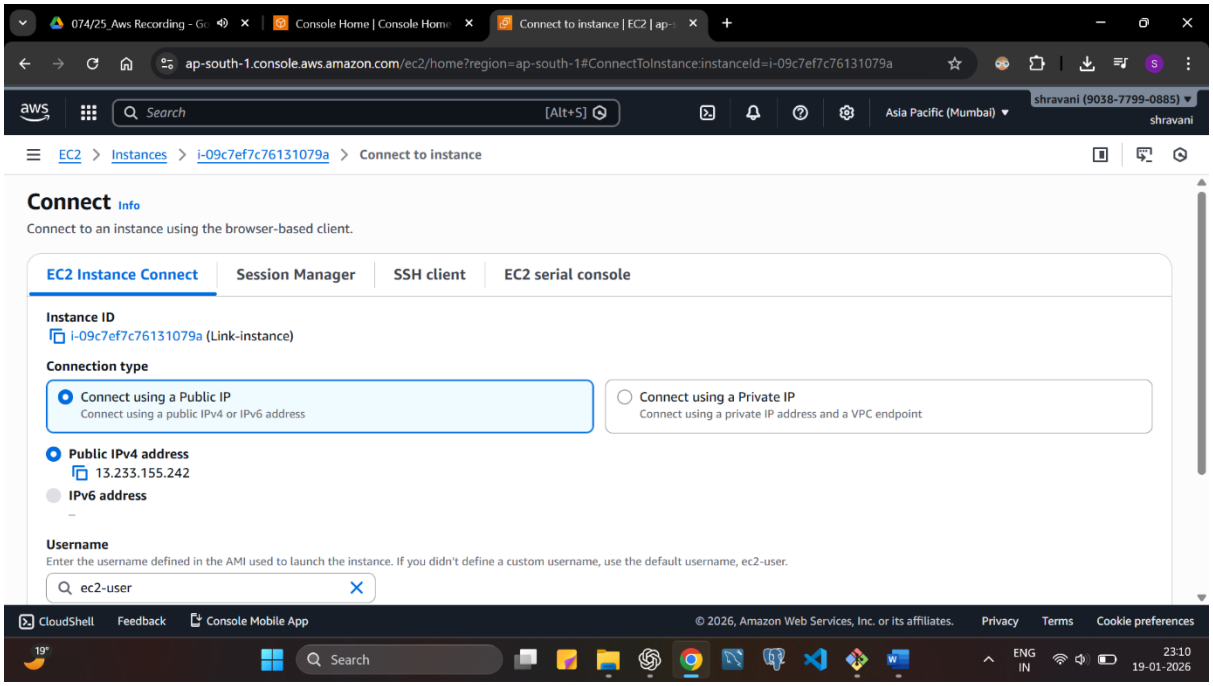


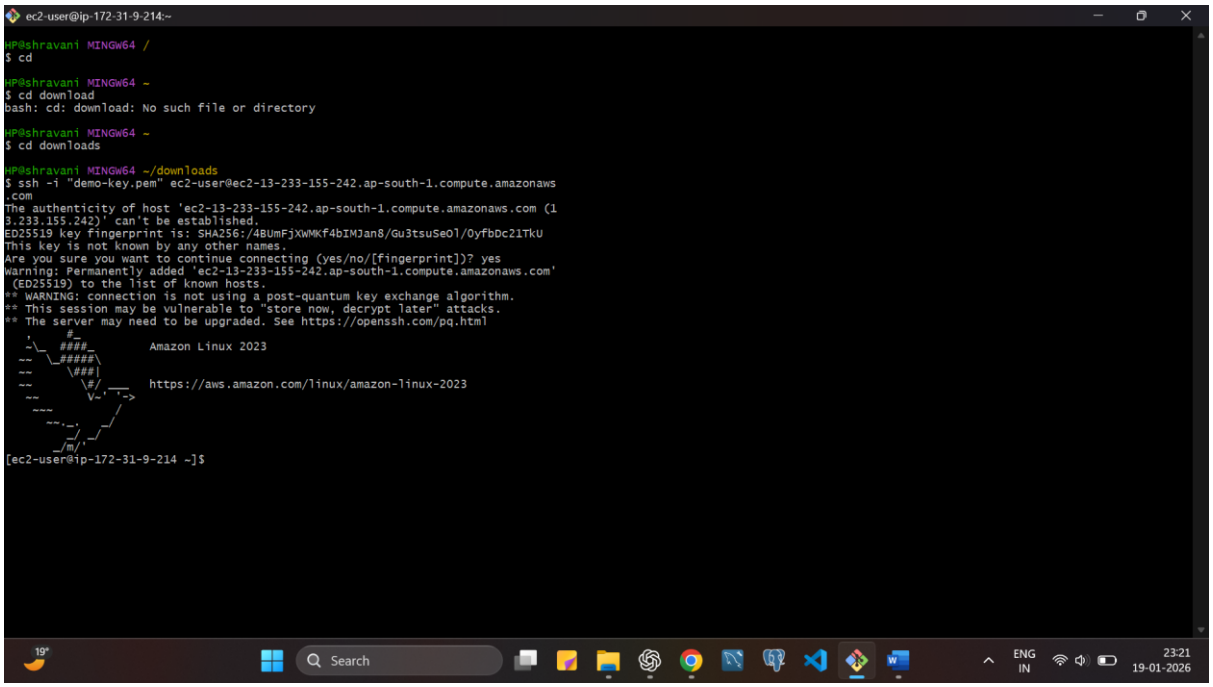
- **Steps to link instance to virtual server**

To link instance to virtual server there 2 methods EC2 connect and SSH client

1. Create instance.

2. Click on connect it will show by using which methods you can connect, if you click on EC2 instance connect it will connect you through browser and if you click on SSH client you can connect it through gitbash or command prompt.





2.connect it through SSH client open gitbash write commands then copy paste the link it will connect you to linux
